

## Lap Siding

Lap siding is a type of exterior siding made up of long, flat boards that overlap each other horizontally starting from the bottom. The overlapping design helps protect the building from moisture and other elements. It was originally only made of wood, but it's now available in fiber cement, and other options.

Here are some characteristics of lap siding:

- Appearance: Lap siding has a classic, timeless appearance that can add a clean, uniform look to any home.
- Profile: Lap siding generally comes in a variety of widths commonly known as the reveal and varying lengths.
- Installation: Lap siding is generally used for whole-house and can make a great accent if your home already has a lot of texture or needs some horizontal lines to compliment the design.

All of the New Day colour styles are available in lap siding and are painted on primed James Hardie Cedar mill 7" reveal x 12' long fiber cement boards.

4" reveal James Hardie boards are available upon request
